The Impact Of Soda, Coffee, And Vinegar On Teeth

For this experiment, you'll need:

- 1 raw egg
- 2 boiled eggs
- One cup of coke
- One cup of black coffee
- One cup of vinegar

Place one boiled egg in the cup of coke and one in the coffee cup.

The raw egg goes into the vinegar.

Let the eggs sit overnight.

Talk about theories on what effect these liquids will have on the eggs.

Surprise!

Next day, the two boiled eggs will be stained brown.

Let children take turns brushing the egg shells with toothbrushes and toothpaste.

The vinegar egg's entire shell will be dissolved, leaving a translucent and smoochy surface behind.

Discuss with the children how this experiment relates to oral hygiene, brushing, and tooth decay.
